

Project description: Deployment of a SIEM/XDR Solution with Wazuh

The objective of this project was to establish a centralized security monitoring environment to detect threats and manage compliance on a Windows endpoint. To achieve this, I deployed a **Wazuh Manager** on a Linux server and configured a remote agent to collect and analyze security events in real-time.

Step 1: Infrastructure Setup (Server-side)

First, I deployed an **Ubuntu Server** instance using Oracle VirtualBox, configuring the network adapter in **Bridged Mode** to ensure local connectivity. I then executed the Wazuh installation script to stand up the Indexer, Server, and Dashboard.

```

IP 192.168.X.XXX

This setup provides the central "brain" of the SIEM, where all logs will be processed and visualized through the web interface.

Step 2: Agent Deployment and Troubleshooting

To monitor my host machine, I installed the **Wazuh Agent for Windows**. Initially, the agent failed to report to the manager due to a configuration mismatch.

I used **Windows PowerShell (Admin)** to manually register the agent: & "C:\Program Files (x86)\ossec-agent\agent-auth.exe" -m **192.168.X.XXX**

Handling Technical Issues

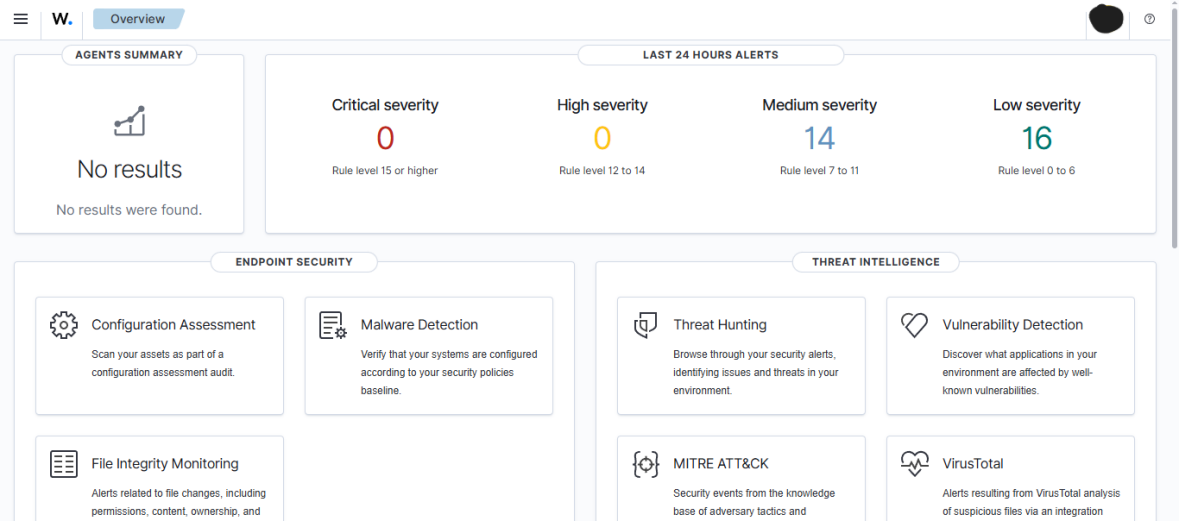

I encountered an issue where the agent service wouldn't start. Upon inspecting the ossec.conf file, I discovered the manager address was set incorrectly to 0.0.0.0. I manually edited the file using **Notepad (Admin)** to point to the correct IP:
192.168.X.XXX

Step 3: Real-time Threat Detection (Brute Force Simulation)

To validate the deployment, I simulated a **Brute Force attack** by intentionally entering incorrect credentials multiple times on the Windows login screen.

The SIEM successfully captured these events, escalating the alert severity as the attempts continued.
